

## Internship Report - English Summary

---

As part of my first year of IT studies at La Joliverie, I was on a six-week work placement with the ACB company. This major firm specifically specialises in manufacturing high-technology forming presses and heavy machinery solely for the demanding aeronautical sector. Working in their IT department was a true revelation for me. During my internship, I was fully integrated into a support team of six people, and the staff were very friendly and welcoming. This supportive atmosphere gave me first-hand knowledge of life in an office and allowed me to understand how vital IT infrastructure is for an industrial company's daily production.

My tutor entrusted me with the important task of deploying and configuring about thirty brand new Lenovo laptops for the company's employees. I was in charge of managing computer network IDs on an Excel file, deeply preparing the software environments using advanced corporate tools, and safely migrating users' data without losing any files. Furthermore, during my work experience, I was expected to help staff members by resolving daily hardware and software incidents through the GLPI helpdesk ticketing system and the TeamViewer remote control software.

From a professional point of view, I expected to put my academic knowledge into practice, but this experience forced me to master new technical skills and modern communication tools much faster. I have gained a lot of autonomy, patience, and self-confidence while communicating and solving problems with stressed users. I genuinely think it was a profitable, useful, and highly valuable experience that helped me to have a much better view of my future career. After having completed this work placement, I absolutely want to carry on with my IT studies and specialize in network infrastructure.
